Description

Como reportado pelo Rafael (rrleme):

> *Cara, acho que tem algum problema com o Condor. Quando eu digito*
>
> *condor_submit arquivo.submit*
>
> *aparece*
>
> *ERROR: Can't find address of local schedd*
>
> *e quando eu digito*
>
> *condor_q*
>
> *aparece*
>
> *Error:*
>
> *Extra Info: You probably saw this error because the condor_schedd is not running on the machine you are trying to query. If the condor_schedd is not running, the Condor system will not be able to find an address and port to connect to and satisfy this request. Please make sure the Condor daemons are running and try again.*
>
> *Extra Info: If the condor_schedd is running on the machine you are trying to query and you still see the error, the most likely cause is that you have setup a personal Condor, you have not defined SCHEDD_NAME in your condor_config file, and something is wrong with your SCHEDD_ADDRESS_FILE setting. You must define either or both of those settings in your config file, or you must use the -name option to condor_q. Please see the Condor manual for details on SCHEDD_NAME and SCHEDD_ADDRESS_FILE.*
>
> *Eu notei este problema ontem de tarde, mas segundo uma pessoa do meu grupo o problema já existia pela manhã.*

History

#1 - 28 Apr 2010 10:42 - Gabriel Winckler

- Status changed from Nova to Resolvida

Esse erro coincide com a atualização do middleware para a versão 1.2.9 (ticket #114)

Hoje pela manhã, o serviço do condor estava desligado.

Executar um vdt-control --on parece ter resolvido o problema.

A causa pode ser uma falha no processo condor ou a não inicialização do mesmo depois do update.

Estou enviando um email avisando os usuários.
